

Duckfins

For swimming or for an adventurous walk along the rocks of the seacoast, the shoe, light and compact, allows for a safe climb on the rocks and a fast entry into water. The duckfins designed with side fins and an ergonomic form eases walking on rocks in the water as well as on land.

The rubber-soles are ripped which allows for a strong grip on the rocks and a safe footing on slippery ground. It is as easy to move in water as with common fins because it adapts optimally to the characteristics of the water currents.

The upper material consists of elastic Neoprene: it is waterproof and fits comfortably to the feet. The duckfins adapt to the natural movement of the seawater and can be used optimally by water-athletes as well as by land-explorers.

Materials:

- Rubber, Neoprene

Characteristics:

- Walking on rocks and fast entrance into water,
Eases walking on rocks in the water and on land

Usage:

- on the rocks or sand of sea coasts
